Intop Office I JM Studio Architektoniczne (Magdalena Ignaczak, Jacek Kunca)

Warsaw I Poland I 2017

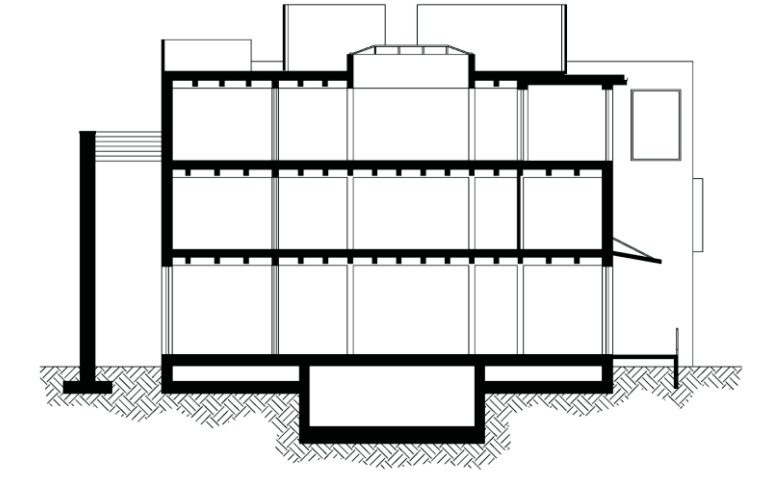
Personalized headquarters – a showcase of the company dealing with civil engineering.

Architectural design was created at the same time with interior design and this is why together they form an inseparable whole. It allowed to create a representative building perfectly fulfilling the customer's needs. The building consists of three overlapping cuboids with different heights and different materials.

Façade materials – Cor-Ten steel, architectural concrete, steel and gabions – all refer to materials used in civil engineering. The don't require maintenance and get nicely covered with patina. Huge glass surfaces make the building look light. Thus the interior becomes a part of the architecture and the facades become a part of the interior.

The building's interior supplements and continues the architectural vision of the exterior.

Interiors are united by ribbed concrete ceilings, concrete floors and walls and glass walls and doors. Overlapping space creates a feeling of togetherness and communication, while ensuring quietness necessary for work. The office building is fully intelligent and easy to manage


Almost all furniture and details are designed individually and constitute an integral part of the interior.
